FROM: Barry Sulkin

On 3-3-82 DEL, MTB, + BWS went to the Trowdale site at ~ 8:00 am. When we arrived, we noted three tanker trucks parked on the off-load pad. A worker was ^{apparently} pumping material from one tanker into another. We observed many barrels on the site - more than had been there a year ago. Nothing had changed since my visit on 3-1-82 w/ Wtr Resources + USGS. Much new gravel appeared to be on the property and things looked neat except for the barrels + the full oil/wtr separator which was full. No sign of dumping on the ground. We noted a sludge residue in the area of the old muck pond next to the RR tracks. The ditch behind Kline's Custom Coach had been partially filled to allow for an extension of their bldg. There was still a pool of wtr next to the new fill. This wtr didn't look as bad as before the fill was added.

We then went to the Croft Spring and noted the orange algae growth as before. There was little or no apparent ~~odor~~ odor from the spring.

There were more barrels than a year or so ago. Sam told me at the sum mtg on 2/23/82 that the extra barrels were the sludge from the blending process.
